

Commercial Farm, IL.

Helping a Farm Go Green

LOCATION	DeKalb, IL
SECTOR	Commercial Farm
MATERIALS	Q Cell solar panels & SolarEdge inverter
SYSTEM SIZE	130 kW

About The Project

Commercial farms are fantastic candidates for going solar, due to their large energy usage, typically having little to no shading on the property, and being eligible for the commercial solar incentives that Illinois offers. This particular project in Malta, IL, was installed on a standing seam pitched roof, at a farm that focuses on organic grain farming. At Windfree Solar, we have been fortunate enough to work on solar installations with commercial farmers all across the state, and we would love to continue that trend. The state incentives, coupled with significant savings and financing options, make going solar at farms very easy and help farmers lower their operating costs, which allows them to use those funds on enhancing other aspects of their operations.
